

Newton's 2nd Law

Newton discovered that:

acceleration varies directly with **force** ...and...

acceleration varies inversely with **mass**.

Thus... $a \propto F$ and $a \propto 1/m$

In a formula: $a = F/m$

because you must consider all forces, and there may be several forces:

$$\boxed{F_{\text{net}} = ma}$$

Practise EASY: USING $F_{\text{net}} = ma$ with F_{net} provided

$$a = 2.7 \text{ m/s}^2 \text{ [E]}$$

$$F_{\text{net}} = 4.2 \times 10^3 \text{ N [E]} \quad m = ?$$

$$F_{\text{net}} = ma$$

$$4.2 \times 10^3 \text{ N} = m (2.7 \text{ m/s}^2)$$

$$m = 1.6 \times 10^3 \text{ kg (rounded to 2 sig. digs)}$$

MEDIUM: USING $F_{\text{net}} = ma$ with F_{net} not provided

$$m = 2.5 \text{ kg} \quad a = 3.0 \text{ m/s}^2$$

$$F_{\text{net}} = ma$$

* $F_{\text{net}} = \text{sum of all forces!}$

$$F_{\text{app}} + F_k = ma$$

$$8.0 + F_k = (2.5 \text{ kg}) (3.0 \text{ m/s}^2)$$

$$F_k = 7.5 - 8.0 = -0.5 \text{ N [S]}$$

The friction is 0.5 N [N]

HARD: USING $F_{net} = ma$ with coefficient of friction

$a = 1.8 \text{ m/s}^2$ $\mu_k = 0.08$ $m = 19 \text{ kg}$ $F_{app} = ?$

$F_{net} = ma$

$F_{app} + F_k = ma$ ****I don't know F_k yet!**

$F_k = \mu_k (F_n) = \mu_k (F_g) = \mu_k (mg)$

$F_k = 0.08 (19\text{kg}) (9.8 \text{ N/kg})$

$F_k = 14.9 \text{ N}$

$F_{app} + (-14.9) = (19) (1.8)$

$F_{app} = \text{_____} \text{ N [fwd]}$
